

GUI BASEED PYTHON ***CALCULATOR***

Presented by: Harshit Mishra

OVERVIEW

This is a simple GUI-based calculator built using Python and Tkinter. It allows users to perform basic arithmetic operations with an interactive interface.

HOW IT WORKS?

The calculator takes user input, processes the expression, and displays the result. It includes buttons for operations, number inputs, and a display screen.

CHALLENGES I FACED

- 01 Tkinter layout and button arrangement.
-
- 02 Handling user input errors.
-
- 03 Implementing advanced features like square root and factorial.
-
- 04 Debugging syntax and runtime issues.

HOW I OVERCAME THEM

Studied Tkinter documentation.

Watched youtube tutorial.

THANK YOU!
